

Image recognition and processing, as well as computer vision, already today represent an extremely important group of AI technologies, and the number of practical applications is rapidly growing.

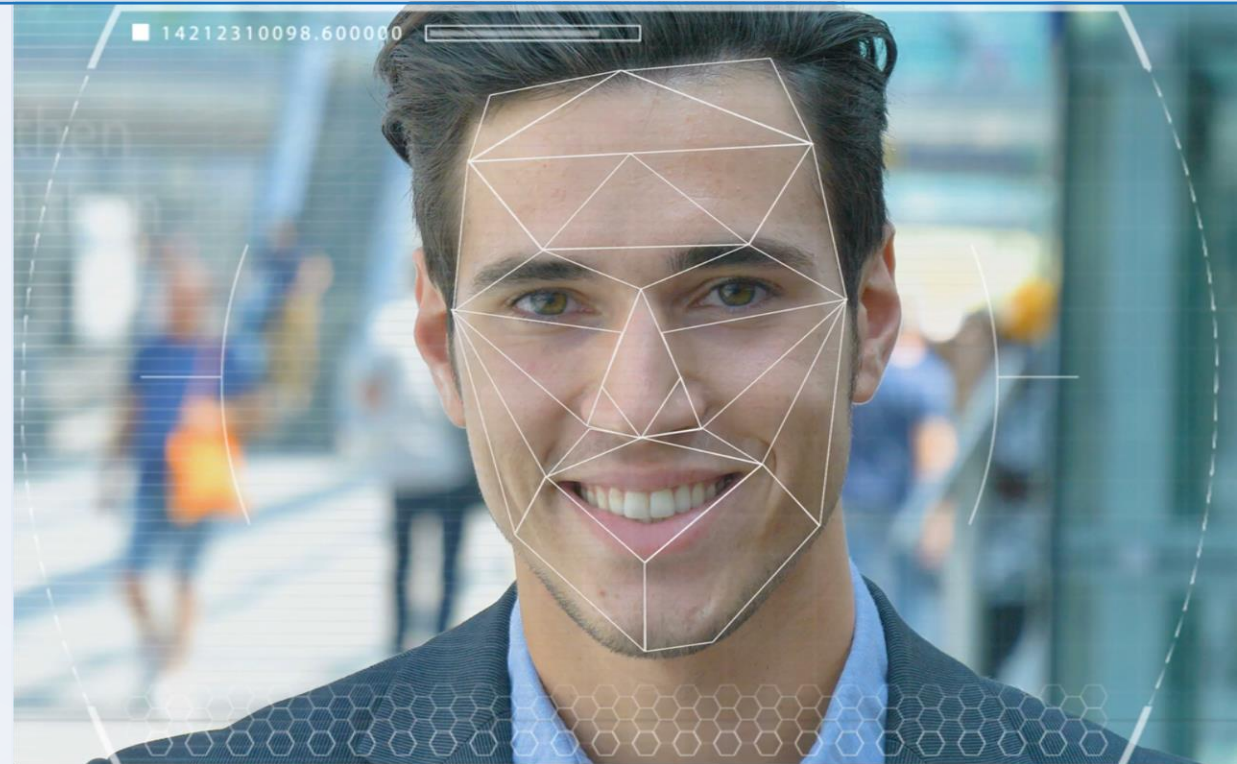

Positive benefits through convincing practical applications

- medical diagnosis and treatment
- agriculture
- logistics
- automated mobile systems
- retail
- banking
- security
- and many more

Face Recognition

- By face recognition individual people can be clearly identified on the basis of their facial features.
- By means of image recognition the camera can also identify the mood of the customer based on facial expressions and body language.

Applications (examples)

- Unlock your smartphone without entering the code
- Enter high-security areas without ID and without key card
- Passport controls at national borders
- Pay conveniently without a credit card and without cash
- Conduct transactions at the ATM
